Hynox Campus Portal Testing Report

Modules 7 8 and 9 — 29 October 2026

The learning progress, activity management and quiz workflows have been corrected and tested from the dashboard through server actions and services to Supabase. The automated checks pass. Student and Teacher journeys have been exercised in native Brave. Selected Admin and Institution Admin checks also passed. This is not production release approval.

Verification results

- Passed: 519 automated tests across 70 files in the final npm test run.
- Passed: production npm run build, TypeScript checking and focused ESLint across 134 files with zero errors and zero warnings.
- Passed: synthetic database integration fixtures for Modules 7, 8 and 9, executed in transactions and rolled back.
- Passed: selected Student and Teacher manual workflows described below, including responsive checks at 320, 375 and 768 pixels.
- Failed then fixed: progress calculation defects, atomicity and access defects, grading and retake defects, and the manual UI defects listed below.
- Blocked for release: eleven delivery tables still require the deferred RLS security pass.
- Untested or pending: simultaneous multi-browser editing, production load and network failure behaviour, exhaustive device coverage, and sandbox execution. Sandbox execution was explicitly excluded by the owner.

Module 7 Learning progress

The previous calculation could select only one enrollment, count optional or ineligible work, use stale stored totals, suppress evidence read errors and reset the start timestamp. The Student sidebar also calculated a lesson-only percentage. These paths now share authoritative database snapshots based on eligible lessons and required activities assigned to the student for the course.

A lesson counts when completed. A required quiz counts only when passed, a project only when approved, and a coding activity only when accepted. Optional work does not block completion. Duplicate assignments or attempts do not add extra units. Draft, archived, deleted, unrelated and inaccessible content is excluded. Empty courses remain at zero. An incomplete course cannot round up to 100 percent; completed status requires exact counts.

Snapshot reads are deduplicated and bounded to batches of 50 students and 100 courses, with no more than four independent RPCs in parallel. Normal Student delivery uses four table reads and one snapshot RPC. Read paths no longer write progress as a side effect. Lesson completion is atomic. Staff averages and Student displays use the same rules, with explicit errors instead of silently substituting misleading values.

Manual result: the retained QA course has one lesson and two required activities. Completing the lesson showed 33.33 percent; after project approval it showed 66.67 percent; after passing the quiz it showed 100 percent, 1/1 lessons and 2/2 required activities. The optional quiz and optional Teacher project remained unfinished. This directly verifies the owner's required-only completion rule.

Module 8 Activity management

Activity creation previously used separate requests for the base activity, subtype, questions and assignments. Failures could leave partial records. Database functions now validate and save related records in one transaction. Assignment retries are idempotent. Scoped helpers check the current role, campus, active parents and Teacher cohort mapping. A standalone assigned Teacher can manage mapped activities without gaining access to other campuses.

Project submission and review are guarded transactions. Students cannot award their own grades or approve submissions. Only assigned persisted projects are accepted; the Student path no longer creates missing projects implicitly. Pending, revision and approved states have distinct completion behaviour. Learning changes participate in dashboard cache invalidation through the existing delivery revision domain.

Manual testing found that staff submission queries omitted the configured passing score and the review drawer displayed a fallback of 50 instead of 60. Both shared projections now return the stored threshold, with two regression tests. The Teacher retest displayed 60. The activity drawer header was clipped by an animated dashboard ancestor; rendering the drawer at the document root fixed it. A regression failed before the change and passed afterwards, and Brave retesting confirmed the header and close button.

The Teacher created a synthetic optional project, saved a draft, published and assigned it to the QA cohort, then edited its title. The Student saw the updated activity. The Student submitted a synthetic repository URL and notes; empty input produced visible validation feedback and malformed input created no submission. The Teacher approved it at 90/100 with feedback. The Student subsequently saw Approved, 90/100, the exact feedback and a locked submission form. The transient malformed-input error message was not captured, so that message itself is not marked passed.

Coding submission and worker code was hardened for authenticated assignment checks, trusted worker credentials, single job claiming and authoritative progress updates. Live sandbox execution and judging were not tested, as requested.

Module 9 Quizzes

Quiz start now derives the eligible assignment and Student context on the server, validates publication and dates, and locks attempt allocation. An active attempt can be retried without creating duplicates. Submission locks the attempt and validates question ownership, option ownership, duplicate answers and answer formats before recording answers, grading and progress atomically. Repeated submission returns the existing result. Expired attempts are closed consistently.

Grading now reconciles the question total with the configured passing-score scale. Multiple-choice answers require the exact correct set. Short-answer aliases are normalized for case and whitespace. Students receive safe question content without answer keys. Raw correct-option access and direct attempt or answer writes are restricted. Attempted quiz questions cannot be changed in ways that corrupt historical grading.

Retake approval now records an additional allowance against a closed unsuccessful attempt without deleting history or decrementing a misleading counter. One approval per unsuccessful attempt prevents duplicate credits. Staff summaries use the stored grading verdict and the attempt's actual maximum score. Manual testing also found that the Teacher approval button appeared only for forfeited attempts; ordinary failed attempts now expose it. The Student counter denominator now includes approved extra attempts.

Manual result: a deliberately blank attempt failed at 0/8 and exhausted the initial 1/1 allowance. The Teacher saw the failed attempt and all four question formats, then approved one retake. A database read confirmed one approval and preserved history. The Student completed attempt 2 with single choice, multiple choice,

true/false and a short answer containing different case and surrounding whitespace. It passed at 8/8. The counter displayed 2/2 and the interface prevented further attempts after passing.

Manual coverage and practical limits

Native Brave was used with the owner's authenticated accounts. Google authentication was completed by the owner. Teacher review, activity creation and retake approval were performed through the interface. Student course discovery, lesson completion, project submission, quiz attempts and final results were also performed through the interface.

Student project overview and form layouts were inspected at 320, 375 and 768 pixels. Text wrapped, primary content remained available, and the mobile navigation worked at 375 pixels. Quiz cards and score badges fit the phone viewport. These checks do not certify every screen, browser or device. A development WebSocket warning was observed during HMR; a completely clean browser console is not claimed.

New course and activity data appeared without a full page reload. No measured production latency claim is made. Simultaneous editing across independent browser sessions and live refresh of an already open project review detail remain unverified. The existing QA cohort lacks attendance start and end dates and displays its existing configuration warning; this was not changed during learning tests.

Real course content and account roles were preserved. Database integration fixtures were rolled back. A clearly named QA M789 course and its synthetic manual submissions were intentionally retained for repeatable review. The manifest is stored beside the Module 9 evidence.

Security and release decision

Production release remains blocked until RLS is addressed for attendance_records, attendance_sessions, cohort_statuses, cohort_teachers, cohorts, course_assignments, course_progress, enrollment_statuses, enrollments, lesson_progress and progress_statuses. The scoped learning-policy fixes do not replace this broader delivery security pass. Supabase advisors also retain configuration and query/index findings that require a separate reviewed security and performance pass.

Before release, finish the pending dashboard checks, exercise production-like load and retries, verify deployment configuration and conduct the deferred security pass. Passing the current suite does not establish that every feature or production condition has been tested.

Evidence locations

Module 7: output/testing/module-07/report.md and database-integration.sql.

Module 8: output/testing/module-08/report.md, database-integration.sql and before/after regression logs.

Module 9: output/testing/module-09/report.md, manual-verification.md, database-integration.sql, live-qa-manifest.json, tests-final.log, build-final.log, types-final.log and lint-final.json.

Existing Modules 1 to 6 changes were preserved. The final focused lint scope includes those earlier module paths as well as the changed learning and quiz paths.

Final dashboard checks

Admin selected the QA campus, loaded the activity creation form and published catalog, and inspected required and optional flags. Its quiz performance view exposed a final denominator defect showing 8/100. The shared console now sums quiz question points; the new regression and Brave retest show Completed and 8/8.

Institution Admin analytics loaded within Hynox QA Campus. Selecting QA M56 Collaborative Group showed one Student, 50 percent average progress across the two assigned courses, 50 percent quiz pass rate across the failed and passed attempts, and 100 percent project approval. These are selected dashboard checks, not exhaustive certification of every staff operation.

One parallel verification run recorded six UI timing failures while build and type checking were running. Its log was retained as tests-resource-contention.log. The subsequent full run passed all 519 tests in 70 files. The final added score-display regression passed. Type checking and focused lint were repeated after the test fixture was completed.
